

Yubikey

SSH

Generating key with a yubikey

Recomendation:

```
ssh-keygen -t ed25519-sk -O application=ssh:YKc-Michel-ndc -O verify-  
required -O user=michel
```

This will generate a non discoverable key that used for signing the generated (ided25519sk) So in order to login to an other system, the private key (ided25519sk) and the non discoverable key (on Yubikey) is needed, beside the Yubikey pin and the passphrase.

```
ssh-keygen -t ed25519-sk -O resident -O application=ssh:YKc-Michel -O  
verify-required -O user=michel
```

This key can be downloaded from the Yubikey.

```
ssh-keygen -t ed25519-sk -O resident -O application=ssh:YKc-Automation-  
Michel -O user=michel -O no-touch-required -C "Michel Pelzer (Automation)-  
mp@nsas.de"
```

This key requires the presens of the Yubikey, but does not need to be touched. (authorizedkeys) *need the no-touch-required in front of the public key.* *<file plain ~/.ssh/authorizedkeys>*no-touch-required
